Course Information

Information technology (IT) has had a significant impact on all businesses, enterprises and organisations through its various applications. Most importantly, it is used to optimise their functioning. No matter how excellent their services and values are, it is not easy for any business to survive in this era of technology with sound IT infrastructure. This means they must embrace a suitable framework for managing this important tool.

COBIT 2019 is a framework designed by ISACA (which stands for Information Systems Audit and Control Association) for enterprise IT governance and management. It has comprehensive guidelines, tools and practices concerning IT governance, risk management and performance management. With COBIT 2019's help, organisations can use their IT systems effectively and achieve their business objectives. This course comprises five detailed topics that include introducing learners to IT and enterprise governance and the COBIT framework.

The remaining three topics explain the practical aspects of the COBIT framework. We will analyse the COBIT product architecture and its CORE model. We also explain how companies can analyse the performance management of their COBIT framework, along with the steps required to restructure and transform. This course includes interesting graphics that will help students understand the COBIT framework and its contents better. So without waiting further, sign up for this course today and build up your basic understanding of the COBIT 2019 framework today!

Modules Studied

Module 1: COBIT IT Governance Foundations

Module 2: Course assessment
